

Motorola Temple Transducers

Innovative headset design lets users receive audio without covering the ear

Temple Transducers enhance communication and safety by not impairing the user's hearing of the external sound environment. Available as a basic model or rugged model to meet specific user needs.

Two Versions, Basic and Rugged

Conventional headsets can often mask external sounds — from approaching traffic to warning alarms and overhead pages — sounds that are crucial for busy professionals to hear.

Temple Transducer headsets utilize temple receivers that convert audio into sound vibration and transmit it to the inner ear. This allows users to hear both radio audio as well as their surrounding environment. In high noise environments it means that users can wear ear plugs with the headset and still receive audio. Each Temple Transducer headset is designed for all-day comfort and features a frame that can be adjusted for an exact fit. Both feature a boom microphone with replaceable windscreen, and in-line push-to-talk (PTT) with clothing clip. Foam earplugs can be used as needed in high noise environments.

RMN4049

Rugged Model
RMN5049

The Difference Between the Two

Temple Transducers are made of flexible steel and feature a behind-the-head style headset. It is ideal for light manufacturing safety professionals as well as for use in hospitality and service industries.

The Rugged Temple Transducer comes equipped with all the features of the basic model plus a boom microphone and larger push-to-talk button. It features an over-the-head band that is fully adjustable and comfortable for extended wear.

This style allows users to wear head gear over the headset. A water resistant boom microphone is included for use in the rain and a secure cap on the PTT prevents accidental activation. Ideal for construction, manufacturing, security teams, government agencies and special forces.
